TRACK 03 / TRANSFER YOUR SKILLS

More editing tools

01 / Choose the right editor

Use the job brief, your system and the handoff requirements to choose an app.

01 Choose Premiere when the production team already works in Adobe and needs an editable Premiere handoff. Confirm plugin and font availability with collaborators.

02 Choose CapCut Desktop for a quick social edit when the project does not depend on a complex professional interchange. Check what your installed version can export.

03 Choose Kdenlive when you need a free, open-source, track-based editor. Test your media and required export format before committing to a long edit.

PRACTICE DEMO

Use the same 30-second brief in two apps and compare setup time, caption control and the quality of the exported file.

QUICK CHECK / FAQ

Do not assume that another app can reopen your timeline faithfully. Agree on a project format, clean master and media handoff before editing.

02 / Adobe Premiere

Make a dialogue-led edit on a conventional timeline.

01 Create a project, organise bins and build a sequence at the required delivery settings. Put dialogue on its own audio track and label it.

02 Mark a source range in the Source Monitor, then add it to the sequence. Use track targeting and the Ripple Edit tool to tighten the cut.

03 Use a separate track for B-roll and titles. Export an H.264 review file through Export and review it at the intended frame size.

PRACTICE DEMO

Build a 30-second case study with a cutaway, clean dialogue and a lower third. Compare your export with the sequence.

QUICK CHECK / FAQ

If the result exports at the wrong frame size, verify both the sequence settings and the Export settings.

More editing tools

03 / CapCut Desktop

Build a clean vertical edit for a social brief.

01 Start a desktop project and import talking-head and B-roll clips. Choose 9:16 if the brief calls for vertical delivery, then check the crop in the preview.

02 Split and remove pauses, then place B-roll over useful words or actions. Set dialogue levels so the voice remains clear.

03 Create captions if your version supports the workflow you need. Correct names and punctuation manually and position the text away from interface overlays.

PRACTICE DEMO

Create a 20-second reel with a hook in the first three seconds, one supporting cutaway, and captions. Watch on a phone before delivery.

QUICK CHECK / FAQ

If captions drift or cut off, watch the export and adjust timing and safe margins before publishing.

04 / Kdenlive

Complete a track-based edit and render it.

01 Choose a project profile that matches the brief, import clips into the Project Bin, and open a clip in the Clip Monitor.

02 Build the rough cut on the timeline, use a second video track for cutaways, then check which tracks are visible and audible.

03 Use the Render dialog to select an appropriate delivery profile. Render to a new file and reopen it outside the editor.

PRACTICE DEMO

Create a 30-second talking-head edit using three tracks. Export it and check picture, audio and any subtitles against the brief.

QUICK CHECK / FAQ

For difficult playback, try proxy clips and confirm originals are available when preparing the final output.

05 / Compare and hand off

Make your work understandable to the next editor.

01 Export matching frame size, frame rate and audio settings in two editors. Use the same footage, caption copy and intended length.

02 Package original media, fonts or font names, graphics, caption files and a written list of export settings. Separate the clean master from platform derivatives.

03 If another editor will take over, verify interchange with a short test and document any titles, effects or audio processing that may need rebuilding.

PRACTICE DEMO

Submit both exports and a five-line comparison covering edit speed, dialogue control, captioning, export and handoff.

QUICK CHECK / FAQ

Can I open any project in another editor? Native files are application-specific. Where interchange is available, test a short timeline first and keep a reference export.
